VibeRewrite 2026

A quick technical and demo guide for the team

Problem Statement 1: turn a rough message into an audience-appropriate draft, then show the original and rewrite side by side with visible changes.

What a user does

Step	In the app
1. Write	Enter a rough message or select Use example.
2. Aim	Choose Executive/C-level, Supportive peer, Legal/compliance, or Gen-Z.
3. Tune	Set formality, verbosity, and enthusiasm; press Rewrite message.
4. Review	Compare original and rewritten text; colored highlights reveal changed words.
5. Use	Choose Plain, Email, Slack, or Markdown; copy or download the draft.

Feature checklist

All 10 requested feature groups are present: input; four personas; rewrite button; result panel; side-by-side comparison; highlighted changes; three tone controls; copy; Email/Slack/Markdown formats with download; and clear empty-input/copy/download feedback plus an example message.

Demo disclosure: this version uses local, deterministic rules. It does not call an AI model. Ask the mentor whether this clearly labeled demo mode is acceptable for judging.

How it actually works

The distinction to explain to judges: Codex helped build the app; Codex is not the app's runtime AI.

Part	Technology	Job
Browser page	HTML + CSS	Layout, responsive design, controls, and readable comparison.
Rewrite engine	Plain JavaScript	Cleans punctuation, applies persona phrase rules, and adds an opening/closing according to the sliders.
Change view	JavaScript token comparison	Finds shared word tokens and highlights original-only and rewrite-only tokens.
Format/export	Browser APIs	Adds simple Email/Slack/Markdown wrappers; copies text or downloads a .txt/.md file.
Local server	Python http.server	Serves static files at localhost:5173 during the demo. It performs no rewrite or model call.

Data flow

Message + persona + tone → browser JavaScript rules → formatted draft + highlighted comparison → copy/download

Why it works without AI

The same input and settings always produce the same result. The code has predefined replacements such as 'bugs' to 'issues' for the executive persona, and adds an appropriate opening or closing. It cannot reason about unfamiliar language or guarantee perfect tone. A human should review every draft before sending it.

What is required for live AI later

There is no approved model API, API key, or AI backend configured in this repository. A live version would need mentor-approved model access, a small backend endpoint, server-side input checks, and a secret key stored outside Git. The browser would send the rewrite request to that backend; the backend would call the model API. Never put an API key in browser JavaScript or GitHub.

Privacy and scope

The current page processes the message locally in the browser. The Python server only serves files. Email and Slack options prepare text for pasting; they do not send messages. The Git repository ignores .env files. The demo does not store entered messages.

Run and explain the demo

A short script that any teammate can use

1. Open PowerShell in the repository and run:

```
Set-Location .\app
python -m http.server 5173 --bind 127.0.0.1
Then open http://127.0.0.1:5173/ in a browser.
```

2. Press Use example and Rewrite message. The sample says testing found bugs and the project needs two more days. Point to the Executive draft and highlighted differences.

3. Select Supportive peer, move one slider, and press Rewrite message again. Show that changing a setting requires a fresh rewrite.

4. Select Email, Slack, and Markdown. Explain these are text formats; then demonstrate Copy draft or Download draft.

5. Say plainly: 'This is a local rule-based demo, not live AI. We would connect an approved backend and model API for generative rewrites.'

Questions you may hear

Question	Answer
Is there AI in the deployed app?	No. The current rewrite uses fixed browser rules. Codex was used to develop the code.
Does the format button send anything?	No. It prepares text for copying or downloading.
Why can a rewrite sound limited?	Rule-based substitution has a small vocabulary and does not understand every sentence.
What would make it live AI?	Organizer-approved API access plus a backend that holds the key securely.

Prompt governance snapshot

As of this guide: 4 exact user messages are recorded by the installed kit. One earlier user setup message predates the logger, making 5 known user-authored messages in this chat. An earlier agent instruction may also count, giving a provisional total of 6. The organizer/mentor decides the official team-wide count; the normal allowance is 30, with limited penalized extras up to 40. Do not alter past logs or invent timestamps.

The handbook describes teams of up to four total members. If 'four teammates' means four in addition to you, verify the roster with the organizer.
